

Hi Coiltek Manufacturing

When working a well known patch in WA with moderate success with the new Coiltek Manufacturing GoldStalker coils on the GPX4500. I decided to try my Coiltek 24DD Pro and 27 x21 MONO coils as the location is a known deep gold producer.

The area had been seriously chained with great results by other good operators so I wasn't surprised for negative results on the first day with the large 24dd Pro coil. Within a hour on the second morning I received a very weak signal on some old chain marks, to clarify the target I fitted the 27 x 21 mono to the GPX4500 and was surprised to hear a very distinct signal about 6" higher than the 24dd pro considering how noisy the ground conditions were.

The 2.1kg specie took over 4 hours to extract and was over 1meter deep thru multiple layers of gravel wash.

The area produced an extra 22oz including another specie found with the mono with over 14oz of gold at a similar depth.

Ian

These are the Pictures of the 2.1kg Specie containing 34oz Gold I found using the 24dd early this year.

The size of the hole can be determined by showing the 27 x 21 mono sitting in the hole at the early stage of digging.

The depth can be determined as the pick is the large 900mm handle sitting on top of the target.
